## Annual Drinking Water Quality Report The Town of Rising Sun, Maryland

We're pleased to present this year's Annual Drinking Water Quality Report. This report is designed to inform you about the quality water and services we deliver to you every day. Our constant goal is to provide you with a safe and dependable supply of drinking water. We want you to understand the efforts we make to continually improve the water treatment process and protect our water resources. This report covers the period of January 1, 2016 through December 31, 2016. This report is being placed in a local paper for general distribution to residents of the Town of Rising Sun. This report is also available at the Rising Sun Town Hall, 1 East Main Street and on our website at: [risingsunmd.com](http://risingsunmd.com).

Your water comes from five municipal wells that vary in depth from 85 feet to 400 feet. All five wells are owned by the Town of Rising Sun and are located within Town limits. The underground source of water is located within fractures of the bedrock. The Town also restricts any activities that could contaminate them. For additional information about your water, you may contact Ron Thomas, Water Plant Operator, at (410) 658-5353 or you may attend a public meeting of the Mayor and Commissioners. The meetings are held the second and fourth Tuesday of each month at 7:00 PM at the Rising Sun Town Hall.

The Town of Rising Sun conducts tests on the drinking water throughout the year as required by State and Federal regulations. Drinking water, including bottled water, may reasonably be expected to contain small amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. Information about contaminants and potential health effects can be obtained by calling the EPA's Safe Drinking Water Hotline (800-426-4791).

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC sets guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium* and other microbial contaminants. These guidelines are available from the Safe Drinking Water Hotline (800-426-4791).

The source of drinking water tap water and bottled water includes rivers, lakes, streams, ponds, reservoirs, springs and wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and, in some cases, radioactive material and can pick up substances resulting from the presence of animals or from humans.

Contaminants that may be present in source water before treatment include:

**Microbial contaminants**, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations and wildlife.

**Inorganic contaminants**, such as salts and metals, which can be naturally occurring or result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining or farming.

**Pesticides and herbicides**, which may come from a variety of sources such as agriculture and residential uses.

**Radioactive contaminants**, which are naturally occurring.

**Organic chemical contaminants**, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also, come from gas stations, urban stormwater runoff and septic systems.

In order to ensure that tap water is safe to drink, EPA prescribes regulations which limit the amount of certain contaminants in water provided by public water systems. We treat our water according to EPA's regulations. Food and Drug Administration regulations establish limits for contaminants in bottled water which must provide the same protection for public health.

## WATER QUALITY DATA

The table below lists all the drinking water contaminants that we detected during the 2016 calendar year. The presence of these contaminants in the water does not necessarily indicate that the water poses a health risk. Unless otherwise noted, the data presented in this table is from testing done January 1, to December 31, 2016. The state requires us to monitor for certain contaminants less than once per year because the concentrations of these contaminants are not expected to vary significantly from year to year. Some of the data, though representative of the water quality, is more than one year old.

### Terms and abbreviations used below:

- **Maximum Contaminant Level Goal (MCLG):** the level of a contaminant in drinking water which there is no known or expected risk to health. MCLGs allow for a margin of safety.
- **Maximum Contaminant Level (MCL):** the highest level of a contaminant that is allowed in drinking water. MCL's are set as close to the MCLG as feasible using the best available treatment technology.
- **Action Level (AL):** the concentration of a contaminant which, when exceeded, triggers treatment or other requirements which a water system must follow.
- **n/a** – not applicable, **nd** – not detectable at testing limit, **ppb** – parts per billion or micrograms per liter, **ppm** – parts per million or milligrams per liter, **pCi/l** – picocuries per liter (a measure of radiation).

### Regulated Contaminants

Contaminant	Dates Tested	Level Detected @ Wells 1, 3, 5, 8	Level Detected @ Well 12	Unit of Measurement	MCL	Likely Source of Contamination
Nitrate	Quarterly in 2016	3.51	5.15	Mg/L	10	Run off from fertilizer Erosion of natural deposits

### Regulated Contaminants

Contaminant	Dates Tested	Level Detected @ Water Tower	Unit of Measurement	Likely Source of Contamination
Bromodichloromethane	8/26/16	2	Ug/L	By Product of Chlorination
Chloroform	8/26/16	1.6	Ug/L	By Product of Chlorination
Dibromochloromethane	8/26/16	1.9	Ug/L	By Product of Chlorination
Bromoform	8/26/16	0.7	Ug/L	By Product of Chlorination

Contaminant	Dates Tested	Level Detected @ Water Tower	Unit of Measurement	Likely Source of Contamination
Monochloroacetic Acid	9/8/16	<2.0	Ug/L	By Product of Chlorination
Monobromoacetic Acid	9/8/16	<1.0	Ug/L	By Product of Chlorination
Dichloroacetic Acid	9/8/16	<1.0	Ug/L	By Product of Chlorination
Dibromoacetic Acid	9/8/16	<1.0	Ug/L	By Product of Chlorination
Trichloroacetic Acid	9/8/16	<2.0	Ug/L	By Product of Chlorination
